

Which is the Right Prediction For My Bus
Arrival Time?

INTRODUCTION

Recent advances in computing technology have made real-time transit vehicle information systems a viable application area. Such applications utilise transit agency schedules and/or actual vehicle location reports. Their utility can be applied to both fleet management and bus rider information system environments. Applications which exist in this area include graphical positioning of buses on window displays for tracking purposes, alarm notification systems telling riders their bus is close to their bus stop, and airport terminal styled arrival/departure status reports relative to some published schedule.

Solution

- **Create a website and app where bus owners can list their buses.**
- **Offer ticket booking options to customers. With our platform, customers can easily find and book the best deals on bus tickets in their area.**
- **Track the location and estimated time of arrival of their buses in real-time.**
